Bangladesh Ecommerce Competitive Intelligence and Marketing Plan

Evidence-led launch plan · 16 October 2026

Decision in one sentence
BizTrackBD should win as the honest, phone-first operating system for Bangladeshi social sellers—but it must repair public proof and mobile conversion before buying reach.

How to read this report

- FACT means directly observed in a cited public or internal source on the stated date.
- INFERENCE means a reasoned conclusion from those facts; it is not a verified market statistic.
- ASSUMPTION means a planning input that must be replaced by measured BizTrackBD data.
- 'Not found' means the evidence was not available in the reviewed public view; it does not prove absence.

FACT Research used live pricing pages, public Facebook page snapshots, exact-page Meta Ad Library queries and a 390 × 844 mobile review. Public Facebook's no-login view prevented defensible 30/90-day post counts. [S04] [S05] [S06] [S19] [S20] [S21] [S22] [S23] [S24] [S27] [S28] [S29] [S30] [S31] [S32]

Executive summary

FACT BizTrackBD's internal context says no real merchant pilot has run, yet the public homepage labels quantified merchant outcomes as 'REAL MERCHANT STORIES'. The pricing and signup pages also publish card-payment, instant-activation, courier, Bangla SMS and '30 seconds' claims that internal marketing rules say require proof. [S01] [S02] [S04] [S05] [S06]

INFERENCE This is the highest-risk growth issue. More traffic would amplify a trust gap before it improves conversion.

FACT Six validated local competitor pages—StoreX, Zatiq, SeloraX, Sellsull, FrameX and ShopZero—showed zero active exact-page Meta ads in Bangladesh on the observation date. [S27] [S28] [S29] [S30] [S31] [S32]

INFERENCE The category's paid creative playbook is not publicly visible today. BizTrackBD should buy structured learning with small tests, not imitate unverified 'winning ads' or assume an uncontested market.

FACT The 390 × 844 review showed horizontal overflow and a desktop-style navigation row on the homepage, pricing and signup pages. [S04] [S05] [S06]

INFERENCE The immediate path is: proof cleanup → mobile repair → event tracking → founding-merchant pilots → verified case studies → controlled paid scale.

Five findings that matter

- The local category is price-dense: observed entry points range from free to low hundreds of taka monthly, while vendors compete on courier, fraud, automation and builder breadth. [S08–S13]
- The strongest open whitespace is not 'more features'; it is operational clarity with verified evidence, plain Bangla and a genuinely phone-first journey.
- A no-signup demo, manual bKash/Nagad verification trail, local plans and ready themes are useful conversion assets—if the demo stays aligned to production truth. [S02]
- Facebook is an important discovery surface, but current public snapshots do not support exact 30/90-day posting claims. The workbook records only what was actually visible. [S19–S24]
- Bitcommerz was removed from the core benchmark because its website-linked Facebook destination appeared unrelated to ecommerce; revalidate before citing it publicly. [S25–S26]

Research scope and limitations

FACT Ten alternatives were selected: six local SaaS vendors, Shopify, WooCommerce plus an agency/freelancer stack, Daraz, and the manual Facebook/Instagram + chat + spreadsheet workflow. [S07] [S09] [S10] [S11] [S12] [S13] [S14] [S15] [S16] [S33]

FACT Pricing is a dated snapshot. Promotional offers, limits and exchange-rate exposure can change; recheck before publishing comparison copy. [S08] [S09] [S10] [S11] [S12] [S13] [S14] [S15] [S18]

FACT Follower and visible-engagement figures are point-in-time public displays, not audited audience quality. Exact historical post totals, ad spend, impressions and targeting were not available. [S19] [S20] [S21] [S22] [S23] [S24]

ASSUMPTION Keyword priorities, campaign budgets and funnel rates are planning hypotheses. The workbook makes the KPI inputs editable and formula-driven.

Competitor landscape

Alternative	Observed public entry	Positioning signal	Implication
StoreX	৳5,000 / 2 years special; annual tiers	Automation, fraud, feature depth	Benchmark its proof and cadence, not its volume claims. [S07–S08]
Zatiq	Free; ৳599/৳1,099/৳2,499	Accessible start and operations	Free entry makes clarity and activation vital. [S09]
Sellsull	Free; ৳500/৳1,500; lifetime	Low price + broad bundle	Do not enter a cheapest-plan race. [S10]
SeloraX	৳1,499/৳2,999 and higher	AI agent and workflow automation	Differentiate with verified outcomes, not generic AI. [S11]
FrameX	Free; ৳599/৳999/৳2,499	Broad local feature stack	Bundle parity alone is weak. [S12]

Alternative	Observed public entry	Positioning signal	Implication
ShopZero	৳999/৳2,499/৳5,999	Human setup + local integrations	Concierge onboarding can be a conversion lever. [S13]
Shopify	$29 yearly-billed / $39 monthly Basic	Global ecosystem	Compete on local workflow and taka simplicity. [S14]
WooCommerce + agency	Free core; variable hosting/extensions	Control and ownership	Frame maintenance and total operating burden honestly. [S15]
Daraz	Category commission; new-seller offer	Marketplace demand access	Position BizTrackBD as owned-channel complement, not universal replacement. [S16–S18]
Manual social stack	Tool-dependent	Familiar, low-friction status quo	The real rival is inertia and inbox habit. [S33]

Selection and rejection logic

FACT The shortlist favors alternatives with a validated live site, visible offer and relevance to Bangladesh merchants. Bitcommerz remains a watchlist item because its website-linked Facebook page appeared to be an unrelated 37-follower crypto/currency page with no posts. [S25] [S26]

INFERENCE StoreKoo and ambiguous ShopX/eCommerceX/Storola identities should be rechecked in 30 days rather than used in public claims now.

Competitor profiles

FACT The blocks below separate what was observed from what was not available. Vendor claims are not treated as independently verified customer outcomes. Competitor mobile speed, complete signup friction, exact 30/90-day post totals, pillar shares and complaint frequency were not measured or not available from the public no-login view.

StoreX

FACT Local ecommerce SaaS for broad SMEs. Public pricing showed a ৳5,000 two-year special and annual Basic/Regular/Advanced plans at ৳11,880/৳23,880/৳59,880, with order and staff limits and overage pricing. [S07–S08]

FACT Website — Observed claims: store templates/landing pages, payments, couriers, fraud checking and automation. CTA and signup-friction details beyond the public pricing path: not fully tested. Mobile speed: not measured. [S07–S08]

FACT Facebook — 20K followers; three current posts were exposed in the logged-out feed at about 4h, 16h and 1d. The latest fraud/cancel-order post had 7 reactions, 1 comment and 1 share plus a WhatsApp CTA. Exact 30/90-day totals remain unavailable. [S19]

FACT Ads / weaknesses — Exact-page Ad Library showed 0 active ads. Start dates, format, copy, destinations and duration: not found. Public complaint corpus: not found; the observable weakness is reliance on aggressive vendor claims that need independent proof. [S27]

Zatiq

FACT Local platform for social sellers and SMEs. Public tiers: Free, ৳599 Starter, ৳1,099 Pro and ৳2,499 Growth; the free tier showed transaction fees and paid tiers expanded product and feature limits. Three-day trial language was visible. [S09]

FACT Website — Observed claims: own store, product limits by tier, custom domain from Starter and theme builder at Pro. Manual TrxID handling, POS and proof depth: not found in this pass. Mobile speed: not measured. [S09]

FACT Facebook — 122K followers; three posts were exposed at about 7h, 11h and 1d. They covered abandoned-cart recovery, all-in-one operations and unified order/payment/delivery management, with 30/11/121 reactions respectively. The page replied to visible comments. Exact 30/90-day totals remain unavailable. [S20]

FACT Ads / weaknesses — Exact-page Ad Library showed 0 active ads. Complaint frequency and related founder/partner-page ad activity: not found. Observable tension: free entry has transaction fees and scale proof is not independently validated here. [S28]

Sellsull

FACT Local builder positioned to price-sensitive merchants. Public offer: Free, ৳500 Professional, ৳1,500 Platinum and ৳60,000 lifetime; the site claims 23 storefront designs, courier integrations, payments, fraud checking and POS. [S10]

FACT Website — Observed CTA/feature breadth is strong, but implementation quality, TrxID workflow, Bangla quality and signup friction were not tested. Mobile speed: not measured. [S10]

FACT Facebook — 24K followers; the only post exposed before the login wall was a reel about 13 hours old using a broad 'best ecommerce website builder' hook, with 1 reaction and 1 comment. Historical best/worst performance: unavailable. [S22]

FACT Ads / weaknesses — Exact-page Ad Library showed 0 active ads. Public complaint corpus: not found. Observable weakness: low engagement on the latest visible post despite a large displayed follower base. [S30]

SeloraX

FACT Local ecommerce SaaS aimed at teams and automation. Basic was ৳1,499/month and Starter ৳2,999/month, with order/SKU/user limits; the site showed a seven-day money-back promise and AI auto-call pricing. [S11]

FACT Website — Observed claims: AI agent, courier integrations, fraud checker, Meta CAPI and landing builder by tier. Merchant/GMV scale numbers are vendor-supplied, not independently verified. Mobile speed: not measured. [S11]

FACT Facebook — 3.2K followers; the only post exposed before the login wall was an AI-agent reel about 15 hours old with 21 reactions and 1 comment. The page displayed 100% recommendation from 14 reviews, but review-text analysis was not completed. [S21]

FACT Ads / weaknesses — Exact-page Ad Library showed 0 active ads. Complaint corpus and founder/partner ads: not found. Observable tradeoff: a distinct AI angle at a higher starting price than several peers. [S29]

FrameX Tech

FACT Local store-builder stack with Free, ৳599 Starter, ৳999 Pro and ৳2,499 Business tiers. Public claims include products/orders by tier, staff, gateways, fraud checking, CAPI and white-label options. [S12]

FACT Website — Observed pricing is competitive and broad. TrxID workflow, mobile-first admin quality, support response and full signup friction: not found. Mobile speed: not measured. [S12]

FACT Facebook — 2.2K followers; latest visible reel was dated 8 October, with 25 reactions, 2 comments and 1 share. One same-date page reply was visible. Exact 30/90-day totals: not found. [S23]

FACT Ads / weaknesses — Exact-page Ad Library showed 0 active ads. Public complaint corpus: not found. Observable weakness: latest visible cadence appeared lighter than StoreX/Zatiq/SeloraX in the snapshot. [S31]

ShopZero

FACT Local ecommerce service combining software with human-assisted setup. Public plans were ৳999 Hobbyist, ৳2,499 Growth and ৳5,999 Scale; an optional ৳5,000 setup fee was visible on the entry plan. [S13]

FACT Website — Observed positioning: own store, local payments/couriers, no per-order fee and implementation help. Detailed TrxID/fraud/POS support and complete signup friction: not found. Mobile speed: not measured. [S13]

FACT Facebook — 556 followers. The only post exposed before the login wall was about one day old and promoted store/domain/courier/payment/Meta-catalog benefits. Engagement totals were not displayed; this is not evidence of zero engagement. [S24]

FACT Ads / weaknesses — Exact-page Ad Library showed 0 active ads. Complaint corpus: not found. Observable tradeoff: assisted setup is valuable but product caps and optional setup cost raise comparison friction. [S32]

Shopify

FACT Global SaaS benchmark. Official pricing showed Basic at $29/month when billed yearly or $39 month-to-month, plus a three-day trial and introductory $1/month period. [S14]

FACT Website — Its ecosystem, checkout and builder maturity are strengths. Bangladesh-specific gateway, TrxID, courier, Bangla and support fit were not validated here and may require apps or partners. Signup friction and mobile speed: not tested. [S14]

FACT Facebook — 4.5M followers. The logged-out page surfaced a 22 June 2022 Shopify Editions video (17K reactions, 21.9K comments and 1.8K shares) rather than a trustworthy current feed. It is a pinned/old-item signal, not evidence of current cadence. [S34]

FACT Ads / weaknesses — Bangladesh exact-page Ad Library analysis was not completed. The honest comparison is ecosystem/control versus local operating simplicity—not a blanket claim that BizTrackBD is better.

WooCommerce + agency

FACT Open-source build alternative. WooCommerce states the core is free with no platform revenue share; its pricing guide estimates hosting and extension ranges, while local agency/freelancer fees remain unverified and highly variable. [S15]

FACT Website — Strengths: ownership, flexibility and extensibility. Tradeoffs: hosting, security, plugin compatibility and delivery responsibility depend on the chosen stack. Bangla/courier/TrxID quality depends on implementation. [S15]

FACT Facebook — The official WooCommerce page showed 213K followers and a latest visible post about one day old: an open-source-control message with 8 reactions. This represents Woo's vendor narrative, not the varied agency/freelancer layer. [S35]

FACT Ads / weaknesses — There is no single agency advertiser identity. Compare total operating burden and service model, not just the free-core price.

Daraz

FACT Marketplace alternative rather than a standalone-store builder. Official seller pages showed a new-seller 0% commission period and category-varying commission structures. [S16–S18]

FACT Website — Strengths: marketplace demand, logistics and seller tooling. Tradeoffs: category commission, platform rules and reduced brand/control compared with an owned store. Signup friction and phone speed were not tested. [S16–S18]

FACT Facebook — The consumer page showed 16M followers and a latest visible Bangla savings post about five hours old with 6 reactions. This is consumer-marketplace content, not a direct SaaS-builder comparison. [S36]

FACT Ads / weaknesses — Ad teardown was not completed. BizTrackBD should position as an owned-channel operating layer that can complement a marketplace, not always replace it.

Facebook/Instagram + Messenger/WhatsApp + spreadsheet

INFERENCE Manual alternative used by social sellers. There is no single list price or vendor; costs and capabilities depend on the merchant's chosen messaging, spreadsheet and staff workflow. [S33]

FACT Website — Strengths: familiarity, phone-native behavior and low setup friction. Weaknesses are inferred fragmentation across inbox, order proof, courier status and reporting—not a verified failure rate. [S33]

FACT Facebook — There is no single page or content strategy to profile.

FACT Ads / weaknesses — There is no single ad library. The acquisition job is to show a low-risk bridge from the merchant's existing page, not demand a total behavior change on day one.

Social and advertising intelligence

Page	Public snapshot	Latest visible signal	Active Meta ads
StoreX	20K followers	3 posts exposed: ~4h / 16h / 1d; latest 7 reactions, 1 comment, 1 share	0 [S19, S27]
Zatiq	122K followers	3 posts exposed: ~7h / 11h / 1d; 30 / 11 / 121 reactions	0 [S20, S28]
SeloraX	3.2K followers	One AI-agent reel exposed ~15h ago; 21 reactions, 1 comment	0 [S21, S29]
Sellsull	24K followers	One reel exposed ~13h ago; 1 reaction, 1 comment	0 [S22, S30]
FrameX	2.2K followers	Latest visible reel 8 Oct; 25 reactions, 2 comments, 1 share	0 [S23, S31]
ShopZero	556 followers	One post exposed ~1d ago; engagement totals not displayed	0 [S24, S32]
Shopify	4.5M followers	Pinned/old 22 Jun 2022 video surfaced; not current cadence	Not collected [S34]

Page	Public snapshot	Latest visible signal	Active Meta ads
WooCommerce	213K followers; verified account	Post ~1d ago; 8 reactions	N/A for varied agency layer [S35]
Daraz Bangladesh	16M followers	Consumer post ~5h ago; 6 reactions	Not collected [S36]

FACT A broad Meta search for the word 'StoreX' surfaced many irrelevant advertisers, so exact Facebook page IDs were used for the ad check. [S27]

INFERENCE Organic themes appear to cluster around fraud, order operations, AI, product walkthroughs and local integrations. This is directional from the latest visible content—not a measured share-of-posts analysis. [S19] [S20] [S21] [S22] [S23] [S24]

INFERENCE Visible engagement varies sharply and follower count alone is not a useful creative-selection rule. BizTrackBD should optimize for demo opens, activated stores and verified merchant outcomes.

Positioning map and claim status

Market space	Low local adaptation	High local adaptation
Self-serve platform	Shopify; generic WooCommerce stack	StoreX, Zatiq, Sellsull, FrameX
Assisted implementation	Agency/freelancer builds	ShopZero; BizTrackBD founding-merchant program
Demand access	Global/social platforms	Daraz marketplace
Operational protection	Apps/plugins assembled by merchant	BizTrackBD opportunity: proof-led TrxID, COD-loss and phone-first workflows

INFERENCE The whitespace is the bottom-right corner: high local adaptation plus operating protection, explained in plain Bangla and demonstrated before signup. Competitors already claim couriers, fraud, builders and automation, so these words alone are not differentiators. [S07] [S09] [S10] [S11] [S12] [S13]

BizTrackBD claim	Status	Why	Marketing rule
Store builder + six templates	Proven	Internal docs list shipped builder/themes	Show live theme previews. [S01–S02]
Bangla/English storefront and local address hierarchy	Proven	Listed as safe-to-talk-about	Use in product walkthroughs. [S02]
Order desk + manual bKash/Nagad TrxID status	Proven	Listed as shipped/safe	Say manual verification trail, not automated gateway. [S01–S02]
Returns, profit view and COD reconciliation	Proven	Listed as safe-to-talk-about	Demonstrate with non-demo data labels. [S02]
Phone-first admin	Partial	Product intent is clear; live mobile marketing pages overflow	Claim only after real-device task tests. [S04–S06]
Courier booking/tracking	Partial	Repo describes implementation; marketing plan requires real external proof	No paid claim until end-to-end booking evidence. [S01–S02]
Fraud protection / cross-store trust	Partial	Fraud-related capability exists; cross-store trust requires proof	Promote free checker utility; avoid prevention-rate claims. [S01–S02]
Bangla and abandoned-cart SMS	Partial	Internal proof gate remains	Keep out of acquisition copy until delivery logs pass. [S02]
Meta CAPI	Partial	Internal proof gate remains	Market only after event reconciliation. [S02]
Custom domain + SSL	Partial	Proof gate remains	Show a live merchant domain before claim. [S02]
POS as a public promise	Partial	Repo context suggests work exists, but public-proof rule says do not claim yet	Pilot first with a physical shop. [S01–S02]

BizTrackBD claim	Status	Why	Marketing rule
Live card subscription payment	Planned / unverified	Pricing page claim conflicts with internal caution	Remove until a real checkout succeeds. [S02, S05]

Positioning and message house

Recommended position
BizTrackBD is the phone-first operating system for Bangladeshi social sellers who want a real store, a clean order trail and clearer profit—without stitching together inboxes, spreadsheets and overseas tools.

INFERENCE Category whitespace: honest operating proof. Competitors publicly emphasize large feature sets, merchant counts, automation and low prices; BizTrackBD can make evidence, clarity and hands-on activation part of the product experience. [S07] [S09] [S10] [S11] [S12] [S13]

Layer	English	Bangla / Banglish
Promise	Run the business, not the inbox.	Inbox না—business system চালান।
Problem	Orders, payment proofs, courier status and profit are scattered.	Order, TrxID, courier আর profit আলাদা জায়গায় ছড়িয়ে আছে।
Mechanism	One phone-first desk from storefront to order follow-up.	Storefront থেকে follow-up—একটা phone-first desk।
Proof	Show the live demo, verified workflows and measured merchant baselines.	Demo দেখান, proof দিন, তারপর claim করুন।
CTA	See it before you sign up.	Account খোলার আগে দেখে নিন।

Audience segments

Segment	Job and objection	Where / words used	Best proof and offer
Facebook page seller with no website	Move from inbox without losing the page audience; fears setup complexity	Facebook groups/pages; 'page থেকে website', 'ফোনে হবে?'	No-signup demo + guided publish
Seller drowning in fake COD orders	Reduce avoidable return loss; doubts any tool can stop fraud	Merchant groups/courier content; 'fake order', 'return charge'	Loss calculator + honest hold workflow
Small physical shop wanting POS + online	Unify stock/sales; fears double entry and downtime	Local trade groups/accountants; 'POS আর online একসাথে'	Proof-gated POS pilot + reconciliation demo
Agency/freelancer building client shops	Deliver faster and support clients; wants margin, control and reliability	Developer/agency groups; 'client store', 'white-label', 'support কে দেবে?'	Partner sandbox, migration checklist and referral terms

Offer and pricing tests

FACT Internal planning lists Starter ৳699, Pro ৳1,499 and Business ৳3,499 with a 14-day trial; these numbers were not independently validated through a live checkout in this research pass. [S02]

INFERENCE Do not answer low-price competitors by discounting every plan. Reduce perceived risk with proof, clear limits, hands-on activation and a bounded founding-merchant program.

Test	Control	Variant	Success metric	Guardrail
Trial framing	14-day free trial	14-day guided launch	Activated-store rate	Support capacity

Test	Control	Variant	Success metric	Guardrail
Primary CTA	Start free	See demo first	Demo→signup→publish	Traffic quality
Founding offer	Standard plan	Limited concierge onboarding	Paid conversion	No fake scarcity
Annual offer	Monthly	Two months equivalent saved	Annual mix	Cash/refund clarity
Migration	Self-serve	Assisted data/template setup	Qualified conversions	Document scope

Organic content plan

ASSUMPTION Cadence: five useful assets per week for four weeks, repurposed across Facebook, YouTube Shorts, LinkedIn and lifecycle messages. The workbook contains the full 20-item calendar.

Pillar	Purpose	Example	Primary KPI
Loss control	Make hidden operating cost visible	Fake COD loss calculator	Calculator start→demo
Product proof	Show real shipped workflow	45-second order desk walkthrough	Demo→signup
Operator education	Teach better process	bKash TrxID checklist	Qualified leads
Build in public	Earn trust before case studies	What founding merchants asked us to fix	Applications
Objection handling	Reduce switching anxiety	Facebook page vs owned store	Signup→publish

Three ready-to-test posts

1 · Loss control
চারটা fake return-এর খরচ শুধু courier charge না—packing, call, blocked stock আর team time-ও আছে। BizTrackBD-এর free calculator-এ আপনার গত ৩০ দিনের সংখ্যা বসান। CTA: ক্ষতির হিসাব করুন।

2 · Demo first
Account খোলার আগে দেখে নিন। ৪৫ সেকেন্ডে order desk, payment status আর customer history—demo খুলুন, তারপর সিদ্ধান্ত নিন। CTA: No-signup demo.

3 · Honest offer
আমরা এখন founding merchants নিচ্ছি। Hands-on setup-এর বদলে চাই honest feedback এবং অনুমতি ছাড়া কোনো result claim করব না। CTA: Apply for onboarding.

ASSUMPTION English variants — (1) 'Four fake returns cost more than courier fees. Add packing, calls, blocked stock and team time. Calculate your last 30 days.' (2) 'See the order desk before you create an account.' (3) 'Founding merchants get hands-on setup in exchange for honest feedback; no result is used without consent.'

Organic operating playbook

- Surfaces: company Facebook page as the main community desk; founder profile for build-in-public proof; YouTube for searchable walkthroughs; LinkedIn for partner/agency credibility. Do not create extra profiles until each has an owner.
- Cadence: 5 Facebook assets/week, 2–3 Reels/Shorts repurposed from them, 1 long-form tutorial every two weeks, 1 live clinic/month, and lifecycle follow-up tied to product events. This is an ASSUMPTION to test against team capacity.

- Groups: answer the question first, disclose affiliation, link only when useful, and never mass-post identical promotions. Track assisted demo opens with tagged URLs.
- Merchant collaborations: screen-record a real setup, co-author the lesson, document baseline/date/result and obtain written consent. Give the merchant approval over the final quote.
- Micro-influencers: pay for teaching a workflow, not vague endorsement. Test one niche at a time; disclose sponsorship; measure qualified demos and activated stores.
- UGC format: problem before, workflow changed, measured outcome, what did not improve, merchant quote, date, consent and CTA. Never script a result the merchant did not achieve.

Season	Useful hook	Lead time	Rule
Eid	COD capacity, cut-off dates, inventory and return planning	6–8 weeks	Avoid guaranteed delivery claims
Pohela Boishakh	Theme refresh and campaign-order checklist	4–6 weeks	Use Bangla-first creative
Puja	Festival catalog, staffing and courier cut-offs	4–6 weeks	Respect inclusive language
Black Friday-style	Margin-safe discount calculator and order readiness	4 weeks	Do not manufacture fake countdowns
School season	Uniform/books/bag catalog and stock planning	4–6 weeks	Segment only relevant merchants
Winter	Seasonal inventory and delivery exception planning	4 weeks	Use merchant data before forecasting demand

Reply playbook

- Acknowledge within the staffed service window; publish that window instead of promising an unmeasured response time.
- Classify: product question, setup blocker, billing, bug, complaint or sales lead. Move private data to DM/phone; keep the resolution summary public when safe.
- Use: ‘ধন্যবাদ—আপনার case-টা বুঝতে ২টা তথ্য দরকার…’ then ask only what changes the answer. Never ask for TrxID, phone or order data in a public comment.
- Close the loop: state what was fixed, offer the next step, tag the issue in CRM and feed repeated objections into content.

Paid Meta learning plan

FACT No active exact-page ads were visible for the six validated local competitors on the observation date. [S27] [S28] [S29] [S30] [S31] [S32]

ASSUMPTION Start with a learning budget, not a growth forecast. Use three spend tiers in the workbook—৳15,000, ৳50,000 and ৳150,000 monthly—only as editable planning scenarios.

Scenario	Spend	Impressions	Clicks	Signups	Activated	Paid
Lean	৳15,000	83,333	833	25	5	0.5
Base	৳50,000	227,273	2,727	109	27	4.1
Growth	৳150,000	576,923	8,077	404	121	21.8

ASSUMPTION These are arithmetic outputs—not forecasts—using scenario CPM ৳180/৳220/৳260, CTR 1.0%/1.2%/1.4%, click→signup 3%/4%/5%, signup→activated 20%/25%/30% and activated→paid 10%/15%/18%. Replace the orange workbook inputs with actual data before any commitment.

Measurement and account setup

- Create one verified Meta Business portfolio with two-admin protection, least-privilege roles, verified domain, documented payment owner and an asset inventory.
- Install Pixel plus consent-aware server events only after event definitions are stable. Deduplicate browser/server events and QA domain, currency and value parameters.
- Define standard events/custom conversions for demo_open, fraud_tool_start, signup_complete, store_published and paid; first_order may remain an internal product event if it is not an ad optimization event.

- Use tagged URLs and one landing page per angle. Do not optimize to cheap leads when the business needs activated stores.

Campaign	Audience	Creative	Optimization	Scale gate
Cold problem education	Broad ecommerce/page-admin interests	Loss math; inbox chaos	Landing-page view initially	Stable clicks + downstream demo signal
Demo intent	Video viewers and site visitors	No-signup demo; theme preview	Demo open / signup start	Qualified signup trend
Activation retargeting	Signup not published	Setup walkthrough; help offer	Store published	Support can absorb volume
Trial conversion	Activated not paid	Outcome recap; plan fit	Paid purchase	Early retention acceptable

Eight ad concepts

- Fake COD loss math — calculator-first; never promise fraud elimination.
- No-signup demo — see the order desk before creating an account.
- bKash TrxID desk — market manual verification honestly until automation is proven.
- Phone-first store — test on real mid-range Android devices before claiming ease.
- Facebook page to owned store — position as complement, not Meta replacement.
- Six ready themes — use only shipped themes and category-specific previews.
- Courier in one desk — activate only after real booking/tracking proof passes.
- Founding merchant program — disclose capacity, terms and deadline; no fake scarcity.

Kill and scale rules

ASSUMPTION Kill a creative after it has enough delivery to judge relative performance and remains materially behind its test set on both attention and downstream intent. Do not use a universal impression threshold before baseline CPM and CTR exist.

ASSUMPTION Scale in 20–30% budget steps only when the same concept produces qualified signups and activated stores across multiple days, onboarding capacity is available, and tracking is clean.

ACTION Build a weekly decision sheet: spend, reach, frequency, link CTR, landing-page views, demo opens, signup starts, activated stores, paid conversions and support load.

Messenger / WhatsApp lead script

- Opening: ‘আসসালামু আলাইকুম—BizTrackBD থেকে বলছি। আপনার দোকান এখন কোথায় চলে: Facebook inbox, spreadsheet, নাকি website?’
- Qualify: ‘মাসে আনুমানিক কত order? সবচেয়ে বেশি সময় যায় কোথায়—payment proof, courier, fake order, নাকি stock?’ Do not request customer lists or payment credentials.
- Route: send the one demo or checklist that matches the stated pain; avoid dumping every feature.
- Close: ‘চাইলে 15-minute setup call-এ আপনার flow দেখে বলব BizTrackBD fit কিনা। Fit না হলে সেটাও পরিষ্কার বলব।’
- Consent: ask before future promotional follow-up; record source and opt-out. Stop after the published follow-up limit if there is no response.

Meta policy and trust guardrails

- Do not imply personal attributes or accuse the viewer of fraud; frame the operational risk generally.
- Do not promise guaranteed income, guaranteed fraud prevention or fabricated before/after outcomes.
- Use real interface captures; label demo data; secure consent for merchant names, faces, messages and outcomes.
- Disclose paid partnerships and referral relationships. Keep pricing, trial and scarcity statements current on the landing page.

Owned, search and partnership channels

ASSUMPTION Prioritize five evidence-led pages first: ecommerce website builder Bangladesh, Facebook order management, bKash payment verification workflow, fake-order checker/calculator, and a balanced Shopify/WooCommerce alternatives hub.

INFERENCE Comparison content should state where the competitor is a better fit. Shopify can win on ecosystem; WooCommerce can win on control; Daraz can win on marketplace discovery. BizTrackBD should win on local operating simplicity only where it is proven. [S14] [S15] [S16] [S17] [S18]

- YouTube: short product proof, merchant setup sessions and live operational clinics.
- Email/SMS: demo follow-up, setup rescue, publish milestone, first-order coaching and trial-expiry recap—with consent and opt-out.
- Lead magnet: fake-order cost calculator that leads to a workflow audit, not a fear-based promise.
- Partnerships: courier/reseller/accounting communities, ecommerce educators and agencies; every referral arrangement must be disclosed.

Conversion review and top fixes

Priority	Finding	Impact	Effort	Action
1	'REAL MERCHANT STORIES' conflict with no-pilot status	Very high	Low	Remove or label illustrative; replace with consented pilots. [S01, S04]
2	Claims exceed internal proof register	Very high	Medium	Create claim owner, evidence URL, date and expiry. [S02, S04–S06]
3	Mobile horizontal overflow / desktop nav	High	Low–medium	Fix responsive nav and overflow at 390px. [S04–S06]
4	Card/instant-activation pricing contradiction	High	Low	Remove until live checkout proves it. [S02, S05]
5	'Launch in 30 seconds' unmeasured	High	Low	Time real users or replace with neutral copy. [S06]
6	Proof path is thin	High	Medium	Add live demo evidence, reliability notes and verified stories.
7	Fraud checker not a primary utility CTA	Medium	Medium	Test above-fold calculator/checker entry.
8	Signup step 1 asks optional detail early	Medium	Low	Defer tagline; condense category cards. [S06]
9	Funnel events not evidenced	High	Medium	Instrument demo→signup→publish→first order→paid.
10	Plan limits / proof-gated features need clarity	Medium	Low	Show limits, overage and availability status. [S02, S05]

Measurement architecture

Stage	Required event	Primary rate	Quality check
Visit	landing_view / pricing_view	Engaged visit rate	Bot/referrer exclusion
Explore	demo_open / fraud_tool_start	Visit→demo/tool	Unique session
Acquire	signup_start / signup_complete	Demo→signup	Valid phone/email
Activate	store_published / integration_connected	Signup→published	Production state
Value	first_order / first_payment_verified	Published→first value	Exclude demo data
Monetize	trial_to_paid / subscription_renewed	Activated→paid	Payment confirmed
Retain	active_store_week / churn	Month-3 retention	Cohort basis

FACT An earlier internal plan used 15% visit→demo, 10% demo→signup, 50% signup→published, 25% published→first order and 15% trial→paid as assumptions—not measured baselines. [S02]

ACTION Keep those historical planning rates out of financial commitments until event QA and at least one complete cohort are available.

KPI	90-day goal	12-month goal rule
Free-store signups	Establish clean source baseline; use scenario model for paid planning	Set quarterly target from proven cost/signup and capacity
Activated stores	Define as published + first real order; measure by cohort	Grow only while support capacity and activation rate hold
Paid conversion	Measure activation→paid and trial→paid separately	Target based on first two complete retained cohorts
Cost per signup / activated	Report weekly by channel and creative	Set ceiling from gross margin/payback after ARPA is verified
Retention	Measure month-1 and month-3 logo retention	Make month-3 retention a scale gate; no invented target
Proof assets	10 qualified founding merchants; 3 consented measured stories	Maintain segment-specific proof library

ASSUMPTION The 10 founding merchants and 3 case studies are operating-capacity targets, not demand forecasts. A numeric 12-month signup or revenue target would be invented without traffic, ARPA, capacity and retention baselines.

30 / 60 / 90 day operating plan

Window	Outcome	Work
Days 0–30	Truth and tracking	Fix claims and mobile overflow; define offer; instrument funnel; prepare proof registry and consent.
Days 31–60	Pilot and learning	Onboard 10 qualified founding merchants; ship 20 content assets; test 6 creatives; release calculator.
Days 61–90	Verified proof and scale decision	Publish 3 measured case studies; launch lifecycle journeys; ship 5 search pages; decide scale/hold.

ASSUMPTION The counts above are capacity targets, not forecasts. Adjust them to support staffing and merchant complexity.

Weekly rhythm, tools and dashboard

When	Meeting / work	Output
Monday	45-minute growth review	One decision per funnel stage; owners and due dates
Tuesday	Merchant calls + product evidence capture	Objections, setup blockers, proof candidates
Wednesday	Creative production and QA	Two variants; claim/source/consent check
Thursday	Experiment readout	Hold/iterate/kill with downstream metrics
Friday	Activation and retention review	Cohort movement, support load, next fixes

- Small-team tool stack: product analytics or warehouse events, a simple CRM pipeline, UTM builder, consent/proof register, Meta Events Manager, Search Console, shared creative library and one dashboard. Choose vendors only after checking data residency, access and cost.
- Weekly dashboard: visits, demo opens, fraud-tool starts, signup starts/completes, published stores, first real orders, paid conversions, spend, cost/signup, cost/activated store, month-1/month-3 retention, support tickets and median activation time.
- Every chart needs source, date range, cohort definition and owner. Separate demo/test stores from production merchants.

Twelve-month direction

- Quarter 1: proof, activation and first cohort economics.
- Quarter 2: repeatable acquisition and partner experiments; publish integrations only after operational proof.
- Quarter 3: segment playbooks for fashion, gadgets and repeat-order categories; improve retention and expansion.

- Quarter 4: scale only channels with verified payback and service capacity; revisit pricing from usage and willingness-to-pay data.

Risks and experiment register

Riskiest assumption	Cheapest decisive experiment	Measure	Stop / pass signal
Phone-first setup is genuinely easy	Observe 5 target merchants on mid-range Android phones	Task completion, time, errors	Fix blockers before ads
Loss-control message creates qualified demand	Two organic posts + calculator prototype	Calculator→demo→qualified call	Continue only with downstream intent
Concierge onboarding lifts activation	Alternate self-serve vs guided cohorts	Signup→published→first order	Keep only if lift justifies support
Courier/payment workflows work in reality	Run scripted and live pilot transactions	Success/error/recovery rate	No paid claim until pass
Founding merchants will pay and stay	10 capacity-bounded pilots with transparent terms	Paid conversion + month-1/3 retention	Do not scale on signup volume alone

Unanswered questions

- Which claims have current end-to-end proof in production: courier booking/tracking, Bangla SMS, abandoned-cart SMS, Meta CAPI, custom domains/SSL and cross-store trust score?
- Can a new merchant complete live subscription payment by card today, and what does ‘instant activation’ mean operationally?
- What are the real last-30-day funnel baselines by source: visits, demo opens, signups, published stores, first orders, paid conversions and churn?
- How many founding merchants can the team onboard per week without harming support quality?
- What data can be imported during migration, and who owns data-cleaning work?
- What plan limits, overages and fair-use conditions will be contractually published?
- What consent language will govern testimonials, screenshots, WhatsApp/SMS follow-up and analytics?
- Which two verticals have the strongest founder access and shortest time-to-first-order?
- Who owns the claim registry and approves copy before publication?
- Which competitor social identities and prices should be refreshed before public comparison pages go live?

What to recheck in 30 days

- Competitor prices, promotions, plan limits and active Meta ads.
- Public Facebook cadence using a logged-in, policy-compliant research view if available.
- Bitcommerz identity and any new entrants such as StoreKoo.
- BizTrackBD mobile overflow, pricing/payment wording and public proof registry.
- First complete acquisition and activation cohort; replace workbook assumptions with measured rates.

Confidence note

FACT Strong evidence: dated public pricing pages, exact-page Meta Ad Library results, the live BizTrackBD mobile review, public follower/latest-post snapshots and the repo’s internal proof rules.

FACT Thin evidence: historical Facebook cadence, pillar shares, review/complaint frequency, competitor signup friction, mobile page speed, founder/partner ad accounts and Bangladesh-specific usage of global platforms. These remain ‘not found’, ‘not collected’ or ‘unverified’ rather than estimated.

ASSUMPTION All funnel rates, paid-media outputs, capacity targets, keyword priorities and creative concepts require live testing. Recheck the items above in 30 days and refresh public comparison content before publishing.

Source register

FACT All public web observations are dated snapshots. Internal repo sources are included because they govern what BizTrackBD can safely claim today.
